Your new epoxy floor is hard-wearing, easy to clean and typically does not require any ongoing maintenance. However, In order to keep your surface looking new you should follow a regular cleaning regime. This will reduce ongoing wear and tear.

STANDARD CURING TIMES

While your epoxy flooring system is extremely durable it must be allowed to cure prior to walking or driving on it to prevent any damage.

- Foot traffic:** 24 - 48 hours after completion.
Light equipment: 3 days after completion.
Vehicle traffic: 7 days after completion.

SWEEP OR VACUUM

Sweeping your surface clean is an integral part of routine maintenance. Surface dirt and loose debris are unsightly and extremely abrasive. It should be removed effectively and regularly using a broom or vacuum. If you use a vacuum cleaner make sure it has a soft brush attachment. The normal hard plastic head on the vacuum could scratch your new floor over time. With outdoor areas you can simply hose it down or use a blower vac.

CLEANING

Cleaning your surface is important to maintain its visual appeal and remove surface contaminants that can be very abrasive. Cleaning can be completed by using a microfibre mop, floor mop or hose and brush/broom. A pH neutral cleaner should be utilised in combination with water and the above agitation methods. Ensure you follow all listed directions on your chosen cleaning product. For textured surfaces, a stiff broom may be used. Do not use abrasive or corrosive cleaners as they can cause discolouration or damage to your surface. On high-gloss surfaces, try to avoid using hard-bristled brooms and brushes as these may scratch the surface of the coating.

STAINS AND SPILLS

While your epoxy surface is resistant to staining and discolouration, all spills and other chemical contaminants should be cleaned from the surface as soon as reasonably possible. This will reduce the possibility of staining as prolonged or extended exposure to some chemicals may result in staining of your surface, especially those that are acidic or corrosive. Staining is only aesthetic and does not affect the mechanical properties of the surface.

HIGH GLOSS SURFACES

High Gloss surfaces such as Metallic Marble, Plain Epoxy or Flake finishes are especially susceptible to scuffing and scratching due to their gloss appearance and the abrasiveness of floor grit and dirt. It is recommended that clean regularly in order to maintain the floor in its original high-end and high-gloss appearance.

It is not recommended to move heavy furniture without mechanical assistance and felt furniture feet should be used on all furniture where it intends to be moveable, such as tables, chairs and stools.

Follow these simple cleaning methods to ensure your epoxy floor stays looking new for many years to come.
